Chapter 1

The Network Protocol

.

1.1 Overview

Loconet is a peer to peer distributed network system on which all devices can monitor the network data flow. The network is event driven by different devices in time, and is not polled by a centralised controller in normal operation. The normal network state is idle, with no data traffic unless a device has information to send. With no traffic flow, the network is quiet.

The network data is sent in asynchronous format using 1 start bit, 8 data bits and 1 stop bit. The 8 bit data is transmitted least significant bit first. The bit times are 60.0 μ S or 16,660 baud +/- 1.5%. A computer can connect to a Digitrax USB interface at higher baud rates and the device will make the necessary conversion. Bytes may be transmitted back-to-back, with a start bit immediately following the stop bit of the previous character.

Any message that has format or framing errors, data errors or is a fragment caused by noise glitches and does not completely follow the message format will be ignored by all receivers, and a new opcode will be scanned for re-synchronisation.

The **Busy** message is included to allow the command station to keep the network active whilst it is performing a task that requires a response, and entails a significant processing delay, i.e. it can ensure no new requests are started until it has responded to the last message. The **Busy** message should be simply stripped and ignored.

If a device disconnects from the network and so does not access or reference a slot within the

system purge time, the command station will force the un-accessed slot to common status so other system devices can use the slot. The typical purge time of a command station is about 200 seconds. A good "ping" or slot update activity is about every 100 seconds, i.e. if a user makes no change to a throttle/slot within 100 seconds, the throttle/device should automatically send another speed update at the current speed to reset the purge timeout for that slot.

1.2 Message Format

All the network communications are via multi-byte messages. The command station is defined as the device that is maintaining the refresh stack for DCC packet generation and is actively generating the DCC track data. Refresh of information is typically only performed for mobile decoders. Stationary type decoders are not refreshed and individual immediate commands are sent out to the track as requested.

The command station is only privileged in respect to performing the task of maintaining the locomotive refresh stack and generating DCC packets. In this way other network transactions may occur that the command station does not need to be involved with or understand, as long as they follow the message protocol and timing requirements. i.e. other devices may have a dialog on the network without disturbing or involving the command station. Devices on the network monitor the messages, check for format and data integrity and parse good messages to decode if action is required in the context. Devices such as throttles, input sensors, computer interfaces and control panels may generate the network messages without needing prompting or polling by a central controller.

Devices frequently will be added and removed from an operating the network. The devices and protocol are tolerant of electrical and data transients. The format chosen gives a good degree of data integrity, guaranteed quick network-state synchronisation, high data throughput, good distribution of access to many competing devices and low event latency. Also, the devices may be operated without need for unique ID or other requirements that can make network administration awkward.

The data bytes on the network are defined as 8 bit data with the most significant bit as an opcode flag bit. If the most significant bit, d7, is 1 then the 7 least significant bits are interpreted as a network opcode. The opcode byte may only occur once in a valid message and is the first byte of a message. The opcode does not necessarily uniquely identify a message type. Sometimes the opcode must be used in combination of other bits or bytes in the message. All the remaining bytes in the message must have a most significant bit of 0, including the last checksum byte. The checksum is the 1's complement of the byte wise exclusive or of all the bytes in the message, except the checksum itself. To validate

data accuracy, all the bytes in a correctly formatted message are exclusive or'ed. If this resulting byte value is 0xFF, then the message data is accepted as good.

The opcodes may be examined to determine message length and if subsequent response message is required. Data bits d6 and d5 encode the message length. The message length includes the opcode and the checksum bytes. The bit d3 = 1 implies that a follow-on message or reply is expected. For variable byte messages The byte following the opcode in the message is a 7 bit byte count.

d7	$\underline{d6}$	$\underline{\mathrm{d}5}$	$\underline{d4}$	$\underline{d3}$	$\underline{d2}$	$\underline{d1}$	$\underline{d0}$	
1	0	0	${ m E}$	D	\mathbf{C}	В	A	2 byte message
1	0	1	${ m E}$	D	\mathbf{C}	В	A	4 byte message
1	1	0	\mathbf{E}	D	\mathbf{C}	В	A	6 byte message
1	1	1	\mathbf{E}	D	\mathbf{C}	В	A	Variable length message.

The A,B,C,D,E are bits available to encode 32 opcodes per message length.

1.3 Refresh Slots

The command station's refresh stack is used to control the locomotives. The refresh stack is an array of read/write refresh slots. There are two protocols for manipulating the refresh slots. Protocol 1 allows up to 120 locomotive slots and each slot contains 10 bytes of data relating to the locomotive. Protocol 2 allows up to 960 locomotive slots and each slot contains 15 bytes of data relating to the locomotive. Not all command stations implement both protocols. A command station may also not implement the maximum number of locomotive slots for the protocols it supports. Where a command station implements both protocols messages from both protocols can be freely mixed. The user should check the TRK status bits to determine if protocol 1 and/or 2 are supported. In this document message mnemonics that are suffixed "P1" belong to protocol 1 and those suffixed "P2" belong to protocol 2. The slot number is a principal component of the protocol and is similar to a file handle. In addition to the locomotive slots there are slots reserved for system and command station control. These slots are numbered 120 to 127 (0x78 to 0x7F) and are encoded differently from the locomotive slots. Slot 123 (0x7B) is allocated to the fast clock. Slot 124 (0x7C) is allocated for read/write access to the programming track and slot 127 (0x7F) contains the command station configuration settings. Protocol 1 uses a single 7 bit number to identify a slot. Protocol 2 uses a 3 bit number to identify the page or bank of slots and a 7 bit number to identify the slot within the page or bank. Within the protocol 2 page slots numbered 0x00 to 0x77 are locomotive slots and slots numbered 0x78 to 0x7F are system slots.

1.4 Getting Started

To request a mobile or locomotive decoder task in the refresh stack, a throttle device requests a slot for the locomotive address by sending either the **getLocoSlotDataSAdr** or **getLocoSlotDataLAdr** commands. Which one depends on what type of decoder address you are using - short 2 digit or long 4 digit. The command station responds with **LocoSlotData** response that contains this locomotive address and all of its state information. If the address is currently not in any slot, the command station will load this new locomotive address into a new slot (speed=0, direction forwards, functions off and 128 step mode) and return this as a **LocoSlotData** response. If no inactive slots are free to load the new locomotive address, the response will be the **Ack** with a fail response code of 0x00.

The throttle/computer must then examine the slot data bytes to work out how to process the command station response. If the slot status 1 byte shows the slot to be "common" or "idle" the throttle may change the slot to "in use" by performing a null move instruction on this slot (see **MoveSlots**). This activation mechanism is used to guarantee proper slot usage interlocking in a multi-user asynchronous environment.

If the slot return information shows the locomotive requested is "in use" or up-consisted (i.e. the SL_CONUP , bit 6 of slot status 1=1) the user should not use the slot. Any up-consisted locomotives must be unlinked before usage. Always process the result from the **LinkSlots** and **UnlinkSlots** commands, since the command station reserves the right to change the reply slot number and can reject the linking tasks under several circumstances. Verify the reply slot number and the link UP/DN bits in slot status 1 are as you expected.

The throttle will then be able to update speed, direction and function information. Whenever slot information is changed in an active slot, the slot is flagged to be updated as the next DCC packet sent to the track. If the slot is part of linked consist slots the whole consist chain is updated consecutively.

If a throttle is disconnected from the Network, upon reconnection (if the throttle retains the slot state from before disconnection) it will request the full status of the slot it was previously using. If the reported status and speed, function data etc., from the command station exactly matches the remembered slot state the throttle will continue using the slot. If the slot data does not match, the throttle will assume the slot was purged free by the system and will go through the setup log on procedure again.

With this procedure the throttle does not need to have a unique ID number. Slot addresses do not imply they contain any particular locomotive address. The system can be mapped such that the slot address matches the locomotive address within, if the user directly reads and writes to slots without using the command station to allocate locomotive addresses.

1.5 Messages

The following information is provided for each of the messages:

Description:

Description of the message's function.

Protocol:

Which protocol the message belongs to. Only messages that relate to refresh slots belong to a protocol.

Group:

Which message size group the message belongs to.

Opcode:

The opcode mnemonic. This is the Digitrax assigned mnemonic when known.

Type:

The message type - broadcast, command, response, or message.

Encoding:

How the message is encoded byte by byte.

Response:

The response expected from a command message, if applicable.

Signature:

The bits and bytes that must be tested to determine the message's unique type.

Notes:

Any notes.

1.5.1 Ack

Description:		
This message provides a response code	e from a comma	nd.
Group:

Notes:		
None.		

1.5.2 Busy

Description:

The **Busy** broadcast message allows the command station to keep the network active whilst it is performing a task that requires a response, and entails a significant processing delay, i.e. it can ensure no new requests are started until it has responded to the last message. The **Busy** message should be simply stripped and ignored.

Group: 2-Byte Message Opcode: OPC_BUSY Type: Broadcast Encoding: Byte 0: 1 0 0 0 01 0x81Opcode. Byte 1: 0 0 0x7EChecksum. 1 Response: None Signature: Byte 0: 1 0 0 0 0 0 0 1 0x81Notes: None.

Option switch table byte 1.

1.5.3 CfgSlotDataP1

Description:

This response provides the current command station configuration slot data. It is sent by the command station in response to the **GetCfgSlotDataP1** command.

Protocol:

1

Group:

Variable-Byte Message

Opcode:

OPC_SL_RD_DATA

Type:

Response

Encoding:

Byte 0:

---	---	---	---	---	---	---	---	------	---------

d5 | d4 | d3 | d2 | d1 | d0 |

Byte 1:

0	0	0	0	1	1	1	0	0x0E	Message length (14 bytes
---	---	---	---	---	---	---	---	------	--------------------------

OST1 to OST6 encode the command station's option switch table. The narrative is based upon information in the the DCS210 and DCS240 user manuals. A bit value of 1 means that the switch is closed and a value of 0 means that a switch is thrown. OpSw 8, OpSw 16, OpSw 24, OpSw 32 and OpSw 40 cannot be read due to bit 7 being cleared in the message format. The manual shows these switches as defaulting to thrown, i.e. 0, and are flagged in all cases except OpSw 40 as "do not change".

Byte 2:

1.5.5 GetBrdOpSw

Description:

Get board option switch setting.

Group:

6-Byte Message

Opcode:

OPC_BRD_OPSW (unofficial mnemonic)

Type:

Command

Encoding:

Byte 0:

1 1	1 0 1	0 0 0 0
-----	-------	---------

Byte 1:

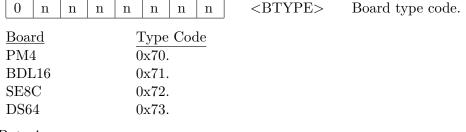

The bit d0 is the most significant bit of the board id.

Byte 2:

Byte 3:

Byte 4:

0	d6	d5	d4	d3	d2	d1	d0	Byte and bit number.
---	----	----	----	----	----	----	----	----------------------

The high nibble encodes the byte number, and the low nibble the bit number. The byte number is calculated as (OpSw# - 1) >> 3 and the bit number is (OpSw# - 1) - byte number \times 8.

Byte 5:

>

Response:

 \mathbf{Ack} ;- *** SHOULD NOT BE A RESPONSE ***

Signature:

Byte 0:

Byte 1:

0	1	1	0	0	0	1	×

Notes:

*** THIS HAS NOT BEEN TESTED ***

$1.5.6 \quad GetCfgSlotDataP1$

Description:

 $1 \quad 0$

Byte 1:

This command requests the configuration slot data. The command station responds with a $\mathbf{CfgSlotDataP1}$ message.

Protocol: 1 Group: 4-Byte Message Opcode: OPC_RQ_SL_DATA Type: Command Encoding: Byte 0: 1 0 0 0xBBOpcode. 1 1 1 1 1 Byte 1: 0 1 1 0x7F1 1 1 1 1 Byte 2: 0 0 0 0 0x000 0 0 0 Byte 3: 0 n n n n n n n <CHK> Checksum. Response: CfgSlotDataP1Signature: Byte 0:

1.5.7 GetInterfaceData

Description:

This command is sent by a computer to request an **InterfaceData** response from the attached network interface device.

Group:

2-Byte Message

Opcode:

OPC_BUSY

Type:

Command

Applicable Hardware:

Digitrax PR4 and DCS240.

Encoding:

Byte 0:

1	0	0	0	0	0	0	1	0x81	Opcode.
---	---	---	---	---	---	---	---	------	---------

Byte 1:

0	1	1	1	1	1	1	0	0x7E	Checksum
---	---	---	---	---	---	---	---	------	----------

Response:

Interface device returns an **InterfaceData** response.

Signature:

None - the command is intercepted by the interface and is not passed on to the network.

Notes:

None.

1.5.8 GetLocoSlotDataLAdrP1

Description:

This command requests the slot number for the selected locomotive address. If the locomotive is found in the slot table then the command station returns an **LocoSlotDataP1** response with the slot information. If it is not found then the command station will put the locomotive into a free slot and then return an **LocoSlotDataP1** response with the slot information. If there are no free slots then the command station returns an **Ack** containing a response code of 0x00.

The command station will generate NMRA 14 bit or long address packets for the locomotive. The address must be in the range 128 to 9983.

Protocol:		
1		
Group:		
4-Byte Message		
Opcode:		
OPC_LOCO_ADR		
Type:		
Command		
Encoding:		
Byte 0:		
1 0 1 1 1 1 1 1	0xBF	Opcode.
Byte 1:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	<adr2></adr2>	Address high 7 bits.
Byte 2:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	<adr></adr>	Address low 7 bits.
Byte 3:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	<chk></chk>	Checksum.

Response:

LocoSlotDataP1 if success, otherwise

\mathbf{Ack}

 $\frac{<\text{LOPC}>}{0\text{x3F}} \ \frac{<\text{ACK1}>}{0\text{x00}} \ \frac{\text{Meaning}}{\text{No free slot, command failed.}}$

Signature:

Byte 0:

1 0 1 1 1 1 1 0xF

Byte 1:

0	n	n	n	n	n	n	n	not equal to 0

Notes:

This command is not supported by the Digitrax DT200 command station.

1.5.9 GetLocoSlotDataLAdrP2

Description:

This command requests the slot number for the selected locomotive address. If the locomotive is found in the slot table then the command station returns an **LocoSlotDataP2** response with the slot information. If it is not found then the command station will put the locomotive into a free slot and then return an **LocoSlotDataV2** response with the slot information. If there are no free slots then the command station returns an **Ack** containing a response code of 0x00.

The command station will generate NMRA 14 bit or long address packets for the locomotive. The address must be in the range 128 to 9983.

Protocol: 2 Group: 4-Byte Message Opcode: OPC_LOCO_ADR_P2 (unofficial mnemonic) Type: Command Encoding: Byte 0: 0xBEOpcode. 1 0 1 1 1 1 0 Byte 1: 0 <ADR2>Address high 7 bits. \mathbf{n} \mathbf{n} \mathbf{n} \mathbf{n} n \mathbf{n} \mathbf{n} Byte 2: 0 n \mathbf{n} \mathbf{n} \mathbf{n} n \mathbf{n} \mathbf{n} <ADR>Address low 7 bits. 1.5.12 GetLocoSlotDataSAdrP1

Description:

This command requests the slot number for the selected locomotive address. If the locomotive is found in the slot table then the command station returns an **LocoSlotDataP1** response with the slot information. If it is not found then the command station will put the locomotive into a free slot and then return an **LocoSlotDataP1** response with the slot information. If there are no free slots then the command station returns an **Ack** containing a response code of 0x00.

The command station will generate NMRA 7 bit or short address packets for the locomotive. The address has the range 0 to 127. The analog locomotive is selected with address 0.

0. Protocol: 1 Group: 4-Byte Message Opcode: OPC_LOCO_ADR Type: Command Encoding: Byte 0: 1 0 1 1 1 1 1 1 0xBFOpcode. Byte 1: 0 0 0 0 0 0 0 0 0x00Byte 2: 0 <ADR> Short address in the range 0 to \mathbf{n} \mathbf{n} n n \mathbf{n} n n 127.

Byte 3:

	0	n	n	n	n	n	n	n	<CHK $>$	Checksum.

1.5.15 InterfaceData

Description:		
This is sent by an interface device in r	response to a ge	tInterfaceData command.
Group:		
Variable-Byte Message		
Opcode:		
OPC_PEER_XFER		
Type:		
Response		
Applicable Hardware:		
Digitrax PR4 and DCS240.		
Encoding:		
Byte 0:		
1 1 1 0 0 1 0 1	0xE5	Opcode.
Byte 1:		
	0x10	Message length (16 bytes).
Byte 2:		
	0x22	
Byte 3:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	0x22	
Byte 4:		
0 0 0 0 0 0 0 1	0x01	
Byte 5:		
0 0 0 0 0 0 0 0	0x00	
Byte 6:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	<d1></d1>	Serial Number low byte low 7 bits.

Byte 7:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	<d2></d2>	Serial Number high byte low 7 bits.
Byte 8:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	<d3></d3>	It contains a value but the meaning is unknown.
Byte 9:		0 4 4 4
0 n n n n n n	<d4></d4>	Unknown - set to zero for PR4 and DCS240.
Byte 10:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	<pxct2></pxct2>	Unknown - set to zero for PR4 and DCS240.

1.5.16 IPLDataLoad

Description:

This command loads firmware data into a device that supports IPL. D1 is the lowest addressed byte and D8 is the highest addressed byte.

Group:

Variable-Byte Message

Opcode:

OPC_PEER_XFER

Type:

Command

Encoding:

Byte 0:

$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	0xE5	Opcode.
Byte 1:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	0x10	Message length (16 bytes).
Byte 2:		
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$	0x7F	Broadcast id.

---	----	----	----	----	----	----	----	-------------	-----------------------------

- d6 1 means this command station implements protocol 2 messages. This can be turned off on the DCS240 by setting the OpSw 44 to be closed.
- d5 Reserved. Set to 0.
- d4 Reserved. Set to 0.
- d3 1 means the programming track is busy.
- d2 1 means this command station implements protocol 1 messages. 0 means the command station is a DT200.
- d1 0 means the track is paused, broadcast an emergency stop.
- d0 1 means the DCC packets are on in the command station and track power is on.

Byte 4:

	0	0	0	0	d3	d2	d1	d0	<pstat></pstat>
--	---	---	---	---	----	----	----	----	-----------------

- d3 1 means user aborted the previous command
- d2 1 means failed to detect read compare acknowledge from decoder
- d1 1 means no write acknowledge response from decoder
- d0 1 means service mode programming track is empty no decoder detected

Byte 5:

0	n	n	n	n	n	n	n	<HOPSA $>$	In operations mode programming
									this contains the 7 high address
									bits of the locomotive to program.
									0x00 if service mode.

Byte 6:

0	n	n	n	n	n	n	n	<LOPSA $>$	In operations mode programming
									this contains the 7 low address
									bits of the locomotive to program.
									0x00 if service mode.

Byte 7:

0	d6 0	0	d3	d2	d1	d0	<TRK $>$	Global system track status.
---	------	---	----	----	----	----	----------	-----------------------------

- d6 1 means this command station implements version 2 slot commands. This can be turned off on the DCS240 by setting the OpSw 44 to be closed.
- d3 1 means the programming track is busy.
- d2 1 means this master implements the Network version 1.1 capability, 0 means the master is a DT200.
- d1 0 means the track is paused, broadcast an emergency stop.
- d0 1 means the DCC packets are on in the master, global power up.

Byte 8:

Dyte 8:

Chapter 2

Fast Clock

2.1 Summary

The command station provides a system fast clock and parameters are stored in slot #123 (0x7B). Use OPC_WR_SL_DATA to write new clock information, The current slot information can be read using OPC_RQ_SL_DATA. This will return an OPC_SL_RD_DATA message containing the fast clock information. This message is called the "sync". Other throttles will update to this sync. Note that all attached display devices keep a current clock calculation based on this sync read value, i.e. devices must not continuously poll the clock slot to generate time, but use this merely to restore sync and follow current rate etc. The clock slot is typically "pinged" or read every 70 to 100 seconds, by a single user, so all attached devices can synchronise any phase drifts. Upon seeing a sync read, all devices should reset their local sub-minute phase counter and invalidate the sync update ping generator.

2.2 Slot #123 Encoding

Byte 0:

Byte 1:

Clock rate. 0x00 means freeze clock, 0x01 means 1:1 rate, 0x0A means 10:1, etc. The maximum value 0x7F means 128:1.

Byte 2:

Byte 3:

	_								
0	n	n	n	n	n	n	n	$\langle FRACH \rangle$	Sub-minute counter high bits

The implementation and meaning of FRACL and FRACH depend upon the specific clock generator. These values should not be used externally. These values are reset when a valid sync message is seen.

That said, the following timing was derived for the DCS240.

Get:

$$maxTick = 0xBFF$$

ticks = maxTick -
$$(0x3FFF - ((\langle FRACL \rangle \& 0x7F) - ((\langle FRACH \rangle \& 0x7F) << 7)))$$

seconds = $60.0 *$ ticks / $(maxTick + 1)$

Set:

$$temp = ticks - maxTick + 0x3FFF$$

$$\langle FRACL \rangle = temp \& 0x7F$$

$$\langle FRACH \rangle = (temp >> 7) \& 0x7F$$

Byte 4:

0	n	n	n	n	n	n	n	<mins></mins>	Fast	clock	m
										-	

Fast clock minutes. This is encoded.

Get:

temp =
$$((255 - \langle MINS \rangle) \& 0x7F) \mod 60$$

$$minutes = (60 - temp) \mod 60$$

Set:

$$<$$
MINS $> = (255 - (60 - minutes)) & 0x7F$

Byte 5:

165

	s.									
d6 Reserved. Set to 0.										
d5 Reserved. Set to 0.										
d4 Reserved. Set to 0.										
d3 1 means the programming track is busy.										
d2 1 means this master implements the Network version										
1.1 capability, 0 means the master is a DT200.										
d1 0 means the track is paused, broadcast an emergency stop.										
d0 1 means the DCC packets are on in the master, global										
power up.										
Byte 6:										
$oxed{0 \ \ n \ \ n \ \ n \ \ n \ \ n}$ HRS> Fast clock hours. This is expression.	encoded.									
Get:										
$temp = ((256 - \langle HRS \rangle) \& 0x7F) \mod 24$										
$hours = (24 - temp) \mod 24$										
Set:										
<HRS $> = (256 - (24 - hours)) & 0x7F$										
Byte 7:										
	er of 24									
Byte 8:										
$ \begin{array}{c ccccccccccccccccccccccccccccccccccc$										
Byte 9:										
$\begin{bmatrix} 0 & n & n & n & n & n & n \end{bmatrix}$ <id1> Device ID low bits.</id1>										
Byte 10:										

ID1 and ID2 indicate the device that last set the clock. 0x00, 0x00 means that not set has happened. 0x7F, 0x7X are reserved for computer use.

Chapter 3

Updating Firmware

3.1 Bootloader Protocol 1

3.2 Bootloader Protocol 2

- 1. The IPL Setup message is sent twice to initiate the download.
- 2. Each block is sent,
- 3. The IPL End Operation message is sent.

A block consists of an IPL Address message following by 1 or more IPL Data messages.

3.4 DMF File Format

The manufacturer's DMF file format is a modified form of the Intel Hexadecimal Object File Format. Character encoding is ASCII. The file consists of multiple "records" each terminated by an ASCII linefeed character (0x0A). There are four types of record and they appear in the file in the following order:

- 1. Sync records
- 2. Parameter records
- 3. Data records
- 4. End of File record

3.4.1 Sync Records

Sync records are used to identify the file as a DMF file. There are six sync records each consisting of a single ASCII # character (0x23).

Example:

#

#

#

#

#

3.4.2 Parameter Records

PARAM MARK	PARAMETER NAME	NAME TERMINATOR	VALUE
! (0x21) < SPC > (0x20)	ASCII text	: (0x3A) < SPC > (0x20)	decimal value
2 bytes	variable bytes	2 byte	variable bytes

PARAMETER RECORD FORMAT

Parameter records start with a two byte PARAM MARK. This consists of the ASCII code for the exclamation mark (0x21) followed by the ASCII code for the space character (0x20). The PARAMETER NAME is next. The PARAMETER NAME is ASCII encoded text identifying the parameter. The PARAMETER NAME may include spaces. It is terminated by the NAME TERMINATOR which consists of the ASCII code for a colon

(0x3A) followed by the ASCII code for a space character (0x20). The last field is the VALUE field. This is a decimal numeric value encoded as ASCII text.

The following parameters have been identified and they are presented in the following order (it is not known if the order is significant):

- 1. Bootloader Version
- 2. Manufacturer Code
- 3. Product Code
- 4. Hardware Version
- 5. Software Version
- 6. Chunk Size
- 7. Delay
- 8. Options
- 9. First Address
- 10. Last Address
- 11. Prog Blk Size
- 12. Erase Blk Size
- 13. Erase Dly

Example:

- ! Bootloader Version: 2
- ! Manufacturer Code: 0
- ! Product Code: 88
- ! Hardware Version: 0
- ! Software Version: 2
- ! Chunk Size: 64
- ! Delay: 50
- ! Options: 2
- ! First Address: 24576 ! Last Address: 73728
- ! Prog Blk Size: 256
- ! Erase Blk Size: 2048
- ! Erase Dly: 100

3.4.3 Data Records

RECORD MARK	RECLEN	LOAD OFFSET	RECTYP	DATA	CHKSUM
(:)					
1 byte	2 bytes	6 bytes	2 bytes	n bytes	2 bytes

DATA RECORD FORMAT

The data record provides a set of hexadecimal digits that represent the ASCII code for data bytes that make up a portion of a memory image.

Each data record begins with a RECORD MARK field containing the ASCII code for the colon (:) character (0x3A).

Each record has a RECLEN field which specifies the number of bytes of data which follows the RECTYP field of the record. Note that one data byte is represented by two ASCII characters. The maximum value of the RECLEN field is hexadecimal "FF" or 255. Although the maximum is 255, the manufacturer seems to prefer 64.

Each record has a LOAD OFFSET field which specifies the 24-bit starting load offset of the data bytes.

The RECTYP field for data records is "00".

Each record has a variable length DATA field, it consists of zero or more bytes encoded as pairs of hexadecimal digits.

Each record ends with a CHKSUM field that contains the ASCII hexadecimal representation of the two's complement of the 8-bit bytes that result from converting each pair of ASCII hexadecimal digits to one byte of binary, from and including the RECLEN field to and including the last byte of the DATA field. Therefore, the sum of all the ASCII pairs in a record after converting to binary, form the RECLEN field up to and including the CHKSUM field, is zero.

The contents of the individual fields within the record are:

RECORD MARK This field contains 0x3A, the encoding of the ASCII colon

(:) character.

RECLEN The field contains two ASCII hexadecimal digits that specify

the number of data bytes in the record. The maximum value

is "FF" or 0x4646 (255 decimal).

LOAD OFFSET This field contains six ASCII hexadecimal digits representing

the address at which the first byte of the data is to be placed.

Most significant digit is presented first.

RECTYP This field contains 0x3030, the hexadecimal encoding of the

ASCII characters "00", which specifies the record type to be

a data record.

DATA This field contains pairs of ASCII hexadecimal digits, one

pair for each data byte.

CHKSUM This field contains the check sum on the RECLEN, LOAD

OFFSET, RECTYP, and DATA fields.

Example:

:400060000057AAC3880FAAC388559AC38855AAC388553AC38855AAC38855AAC3884AO 0C38855AAC38855AAC3882DFCC38861B8C3882DFCC38861B8C3886D

3.4.4 End of File Record

RECORD MARK	RECLEN	LOAD OFFSET	RECTYP	CHKSUM
(:)	"00"	"000000"	"01"	"FF"
1 byte	2 bytes	6 bytes	2 bytes	2 bytes

END OF FILE RECORD FORMAT

The End of File Record specifies the end of the file.

The contents of the individual fields within the record are:

RECORD MARK This field contains 0x3A, the encoding of the ASCII colon

(:) character.

RECLEN The field contains 0x3030, the hexadecimal encoding of the

ASCII characters "00". Since this record does not contain

any DATA bytes, the length is zero.

LOAD OFFSET This field contains 303030303030H, the hexadecimal encod-

ing of the ASCII characters "000000", since this field is not

used for this record.

RECTYP This field contains 0x3031, the hexadecimal encoding of the

ASCII characters "01", which specifies the record type to be

an End of File Record.

CHKSUM This field contains the check sum on the RECLEN, LOAD

OFFSET, and RECTYP fields. Since all the fields are static, the check sum can also be calculated statically, and the value is 4646H, the hexadecimal encoding of the ASCII characters

"FF".

Example:

:000000001FF

Chapter 4

Programming Configuration Variables (CVs)

4.1 Introduction

The decoders installed in your locomotives provide you with the ability to create a more realistic operating experience through the configuration variables (CVs for short). The network protocol supports configuration of up to 1024 CVs.

It is a good idea to run your decoders with the default CV values that come pre-programmed in your decoders until you get used to the performance characteristic and how they work on your layout. Once you are comfortable with running the trains, then you can begin customizing locomotive characteristics.

Each CV (configuration variable) controls a specific characteristic of the decoder, which in turn controls how the locomotive performs. See your decoder manual for a list of the most commonly used CVs and their meanings. Each decoder comes pre-programmed from the factory with the default settings outlined in your decoder manual. You can change your decoder's performance characteristics by changing the CV values entered in the CVs you want to change. Each of these CVs can be set up when your command station is in the programming mode. The CVs are remembered in the decoder until it is reprogrammed to with a different CV value. Please refer to your mobile decoder manual for a complete listing of the CVs supported by each decoder.

Programming decoder CVs is usually done on an isolated programming track.

There are four programming modes:

- Paged mode
- Physical register mode
- Direct mode
- Operations mode

4.1.1 Paged Mode Programming

4.1.2 Physical Register Programming

Physical Register Mode can only read CV01-CV08. You should not rely on values in the display for CVs above 08 when reading back in physical register mode.

4.1.3 Direct Mode Programming

This is the preferred programming mode.

4.1.4 Operations Mode Programming

Operations mode programming lets you program CVs in locomotives equipped with Extended Packet Format decoders while they are on the mainline. A typical use for Ops mode programming would be to change the acceleration rate (CV03) or the deceleration rate (CV04) of your locomotives to simulate the weight and braking capability of the train to compensate for changing the number of cars or power units on a train.

Operations Mode read back can only be used with decoders that are capable of operations mode read back when there is a device attached to the network that supports operations mode read back. Digitrax transponding decoders and the DCS210 or DCS240 command stations would allow operations mode read back.

4.2 Programming Mobile Decoder Addresses

Be sure that only the loco you want to program is on the programming track. If you are using operations mode programming, the loco you want to program can be anywhere on the layout but it must have a decoder that is capable of operations mode programming installed.

There are two addressing methods - short and long. The short addresses can take a value between 0 and 127, and long addresses a value between 128 and 9983. The bit 5 of mobile decoder's configuration register (CV29) determines what addressing method is used. If bit 5 is set to 1 then long addresses are used, and when bit 5 is 0 then short addresses are used. Short addresses are stored in CV1, and long addresses in CV17 and CV18. The address values stored in CV17 and CV18 are not the high and low bytes of the address value. The CV17 and CV18 values must be calculated from the address value as follows:

```
TEMP = address + 49152
CV18 = TEMP \& 0xFF
CV17 = TEMP >> 8
Example:
address = 4007
TEMP = 49152 + 4007 = 53159 = 0xCFA7
CV18 = 0xA7 = 167
CV17 = 0xCF = 207

4.3 List of all supported CVs

CV	Name	Description	Range	<u>Value</u>
1	Loco address	Address of engine (For Multiprotocol decoders: Range 1-255 for Motorola)	1 - 127	3
2	Start voltage	Sets the minimum speed of the engine	1 - 255	3
3	Acceleration	This value multiplied by 0.25 is the time from stop to maximum speed. For LokSound 5 DCC: The unit is 0.896 seconds	0 - 255	28
4	Deceleration	This value multiplied by 0.25 is the time from maximum speed to stop. For LokSound 5 DCC: The unit is 0.896 seconds	0 - 255	21
5	Maximum speed	Maximum speed of the engine	0 - 255	255
6	Medium	Medium speed of the engine. Use only if 3-		
·	speed	point speed table is enabled. For LokSound 5 DCC only.		
7	Version num- ber	Internal software version of decoder	-	-
8	Manufacturer's ID	s Manufacturers's ID ESU - Writing value 8 in this CV triggers a reset to factory default val- ues	151	-
9	Motor PWM Frequenz	Motor PWM frequency as a multiple of 1000 Hz.	10 - 50	40
13	Analog Modus F1-F8	Status of functions F1 to F8 in analogue mode (see chapter 12.7)	0-255	1
14	Analog Modus FL, F9-F15	Status of function F0, F9 to F12 in analogue mode (see chapter 12.7)	0-63	1
15 & 16	Decoder Lock	Decoder-Lock Function according to NMRA. For details please see:	0 - 255	0
		http://www.nmra.org/standards/DCC/WGpu	ablic/030508	51/0305051.html
17 & 18	Long address of the loco	Long address of engine (see chapter 9.2)	128 - 9999	192
19	Consist Address	Additional address for consist operation. Value 0 or 128 means: consist address is disabled. 1 – 127 consist address active, normal direction. 129 – 255 consist address active reverse direction.	0-255	0
21	Consist Mode F1-F8	Status of functions F1 to F8 in Consist mode. Meaning of the bits as in CV 13	0-255	0
22	Consist Mode FL, F9-F12	Status of functions FL, F9 to F12 in Consist mode. Meaning of the bits as in CV 14.	0-63	0
23	Adjust Acceleration	Factor for adjusting Acceleration CV 3. Values from 0 to 127 are added to CV 3. If the values are to be subtracted, additionally set bit 7 (value 128). The unit is 0.896 seconds.	0 - 127	0

CV 24	Name Adjus eratio	st Decel-	Description Factor for adjusting the deceleration CV values from 0 to 127 are added to CV 3. If the values are to be subtracted, additionally so bit 7 (value 128). The unit is 0.896 seconds	ne et	_	<u>alue</u>
27	Brake	e mode	Allowed (enabled) Brake modes 28	٠.

$\underline{\mathrm{CV}}$	<u>Name</u>	Description	Range	$\underline{\text{Value}}$
51	K Slow Cut- off	Inernal Speedstep, until K Slow is active	0 - 255	10
52	BEMF Param. K	Portion of the PI-Controller valid for lower speed steps	0 - 255	10
53	Slow "K" - Control Reference voltage	Defines the Back EMF voltage, which the motor should generate at maximum speed. The higher the efficiency of the motor, the higher this value may be set. If the engine does not reach maximum speed, reduce this parameter	0 - 255	130
54	Load control Parameter K	K-component of the internal PI-controller. Defines the effect of load control. The higher the value, the stronger the effect of Back EMF control.	0 - 255	50
55	Load control Parameter I	I-component of the internal PI-controller. Defines the momentum (inertia) of the motor. The higher the momentum of the motor (large flywheel or bigger motor), the lower this value has to be set.	0 - 255	100
56	BEMF Influence at VMin	0-100%. Defines the "Strengh" of the BEMF at minimum speed step	1 - 255	255
57	Steam chuff synchronisa- tion #1	Defines the steam chuff synchronisation. See chapter 13.3.	1 - 255	30
58	Steam chuff synchronisa- tion #2	Defines the steam chuff synchronisation. See chapter 13.3.	1 - 255	20
63	Sound volume "Master"	Master volume for all sounds.	0 - 192	128
64	Brake sound threshold "Brake On"	If the actual loco speed step is smaller than or equals the value indicated here, the brake sound is triggered. Compare chapter 13.4.	0 - 255	60

CV 65	Name Brake sound threshold "Brake Off"	Description If the actual loco speed step is smaller than the one indicated here (up to 255), the brake sound will be switched off again. Compare chapter 13.4.	Range 0 - 255	<u>Value</u> 7
66	Forward Trimm	Divided by 128 is the factor used to multiply the motor voltage when driving forward. The value 0 deactivates the trim.	0 - 255	128
67-94	Speed table	Defines motor voltage for speed steps. The values "in between" will be interpolated.	0 - 255	-
95	Reverse Trimm	Divided by 128 is the factor used to multiply the motor voltage when driving backwards. Value 0 deactivates the trim.	0 - 255	128
101	Shunting Mode Trimm	Divided by 128, this gives the factor by which the motor voltage is multiplied when the shunting gear is active. See section 10.1.2.	0 - 128	64
102	Brake Mode Exit Delay	Time as a multiple of 16 milliseconds that must pass before a detected braking distance is left again. See section 10.4.6.	0 - 255	12
103	Load adjustment "Optional Load"	Divided by 128, this gives the factor that changes CV3, CV4 and the sound when "Optional Load" is active. See section 10.7.	0 - 255	0
104	Load adjustment "Primary Load"	Divided by 128, this gives the factor that changes CV3, CV4 and the sound when "Primary Load" is active. See section 10.7.	0 - 255	255
105	User CV #1	Free CV. Here you are able to save what ever you want.	0 - 255	0
106	User CV #2	Free CV. Here you are able to save what ever you want.	0 - 255	0
111	Gearbox backlash	Time as a multiple of 16 mS, for which the motor runs at minimum speed after reversing the direction to prevent gear box jerking.	0 - 255	0
112	Frequency for Flashing light effects	Flashing frequency for Strobe lighting effects. Multiple of 0.065536 seconds. See section 12.5.4.	0 - 255	20
113	Power Fail Bypass	The time that the decoder bridges via the PowerPack after an interruption of voltage. Unit: A multiple of 0.032768 sec. See section 6.12.2.	0 - 255	32
116	Slow speed BEMF Sam- pling period	Frequency of BEMF measurement in 0.1 milliseconds at speed step 1	50 - 200	50
117	Full speed BEMF Sam- pling period	Frequency of BEMF measurement in 0.1 milliseconds at speed step 255	50 - 200	150

<u>CV</u> 118	Name Slow speed BEMF	Description Measurement gap length VMin Length of the BEMF measuring gap in 0.1 milliseconds at	$\frac{\text{Range}}{10 - 20}$	<u>Valu</u> 150	<u>1e</u>
119	Full speed BEMF	speed step 1 Measurement gap length Vmax Length of the BEMF measuring gap in 0.1 milliseconds at speed step 255	10 - 20	15	
123	ABC Mode "Slow drive"	Speed which is valid in the slow driving section during ABC braking.	0	-	
124	Extended	Additional important settings for decoders		21	
121	Configura-	Traditional important bettings for decodors			
	tion #2				
	Bit Descrip	tion			Value

	Enable	SUSI protocol			8
	4 Enable	Output AUX9 (LokSound 5 H0 only)			0
	Enable	Wheel Sensor input (LokSound 5 H0 only)			16
	5 Motor 6	Overload Protection			
		s not switched off when blocked.			0
	Motor i	s switched off for a few seconds when blocked to	o avoid buri	out	32
		Automatic parking Brake			0
		Automatic parking Brake (EMK Braking)			64
	7 Reserve				128
125	Start voltage	Analog DC See section 10.8.	0 - 255	90	
126	Maximum speed	Analog DC See section 10.8.	0 - 255	130	
127	Start voltage	Analog AC See section 10.8.	0 - 255	90	
128	Maximum speed	Analog AC See section 10.8.	0 - 255	130	
129	Analog Functions	"Hysterese" Offset voltage for functions in analogue mode. Chapter 10.8.	0 - 255	15	
130	Analog Mo- tor	"Hysterese" Offset voltage for motor functions in analogue mode. Chapter 10.8.	0 - 255	5	
132	Grade Crossing Hold Time	Grade Crossing holding time. See chapter 12.5.3.	0 - 255	80	
133	Sound Fader	Volume when sound fader is active. See chapter 13.5.	0 - 255	128	
134	ABC-Mode "Sensibility"	Threshold, from which asymmetry on ABC shall be recognised.	4 - 32	10	

$\underline{\text{CV}}$	$\underline{\text{Name}}$	Description	Range	<u>Value</u>
138	Smoke Unit	Divided by 128, this gives the factor by which	$\overline{0} - 255$	128
	Trim Fan	the fan speed of synchronized smoke units can		
		be adjusted.		
139	Smoke Unit	Divided by 128, this gives the factor by which	0 - 255	128
	Trim Tem-	the temperature of synchronized smoke units		
	perature	can be adjusted.		
140	Smoke Time-	Time until automatic shutdown of the smoke	0 - 255	255
	Out	unit.		
141	Smoke Chuff	Minimum duration of a steam chuff of an ex-	0 - 255	10
	Min	ternal smoke unit in 0.041 seconds resolution.		
142	Smoke Chuff	Maximum duration of a steam chuff of an ex-	0 - 255	125
	max	ternal smoke unit in 0.041 seconds resolution.		
143	Smoke Chuff	Divided by 128, this gives the factor by which	0 - 255	100
	Length	the duration of the steam chuffs can be ad-		
		justed relative to the trigger pulses.		
144	Smoke Pre	Preheating temperature in degrees Celsius for	0 - 255	150
	Heat Tem-	secondary smoke generators (cylinder smoke		
	perature	unit)		
149	ABC Shut-	Time in seconds, which has to be passed for	0 - 255	255
	tle Train	ABC shuttle train operation, before the direc-		
	Holdtimet	tion of travel is changed. See section 10.4.4.3.		
150	HLU	HLU Speed limit 1. Internal speedstep.	0 - 255	42
	Speedlimit 1			
151	HLU	(U) HLU Speed limit 2 (U). Internal speed-	0 - 255	85
	Speedlimit 2	step.		
152	HLU	HLU Speed limit 3. Internal speedstep.	0 - 255	127
	Speedlimit 3			
153	HLU	(L) HLU Speed limit 4 (L). Internal speed-	0 - 255	170
	Speedlimit 4	step.		
154	HLU	HLU Speed limit 5. Internal speedstep.	0 - 255	212
	Speedlimit 5			
155 - 170	Sound CV 1 -	16 CVs for selecting sounds that can be as-	0 - 255	0
	Sound CV 16	signed within sound projects. Please note the		
		documentation for the sound project.		
179	Brake Func-	Deceleration Value of which 33% of CV 4 will	0 - 255	80
	tion 1	be deducted if the Brake Function 1 is active.		
		See section 10.6.		
180	Brake Func-	Deceleration Value of which 33% of CV 4 will	0 - 255	40
	tion 2	be deducted if the Brake Function 2 is active.		
		See section 10.6.		
181	Brake Func-	Deceleration Value of which 33% of CV 4 will	0 - 255	40
	tion 3	be deducted if the Brake Function 3 is active.		
		See section 10.6.		
182	Brake Func-	Speed Highest speed step that can be reached	0 - 126	0
	tion 1 max .	when Brake function 1 is active.		

<u>CV</u> 183	Name Brake Func-	Description Speed Highest speed step that can be reached	$\frac{\text{Range}}{0 - 126}$	Value 126
184	tion 2 max. Brake Function 3 max.	when Brake function 1 is active. Speed Highest speed step that can be reached when Brake function 1 is active.	0 - 126	126
246	Automatic decoupling Driving speed	Speed of the loco while decoupling; the higher the value, the faster the loco. Value 0 switches the automatic coupler off. Automatic decoupling is only active if the function output is adjusted to "pulse" or "coupler".	0 - 255	0
247	Decoupling - Removing time	This value multiplied with 0.016 defines the time the loco needs for moving away from the train (automatic decoupling).	0 - 255	0
248	Decoupling - Pushing time	This value multiplied with 0.016 defines the time the loco needs for pushing against the train (automatic decoupling).	0 - 255	0
249	Minimum steam chuff distance	Minimum distance of two steam chuffs, independant from sensor data. Compage chapter 13.3.	0 - 255	0
250	Secondary steam chuff trigger	Defines the distance between two consecutive steam chuffs for the secondary steam chuff generator. The value indicates the promilles the steam chuff distances of the secondary steam chuff generator ought to be shorter then those of the primary steam chuff generator. It is needed for steam locos with two independent boogies, such as "Big Boy" or "Mallet".	0 - 255	0
253	Constant brake mode	Determines the constant brake mode. Only active, if $CV254 > 0$ Function CV 253 = 0: Decoder stops linearly CV 253 > 0: Decoder stops constantly linear	0 - 255	0
254	Constant braking distance forward	A value > 0 determines the way of brake distance it adheres to, independent from speed.	0 - 255	0
255	Constant braking distance backward	Constant braking distances during reverse driving. Only active, if value > 0, otherwise the value of CV 254 is used. Useful for reversible trains.	0 - 255	0
